

ANP Advantage For Security Management

Your Challenge

The ANP Net eWareSM Solution

“Our company wants strong IT security, but we need to provide it in a cost-effective manner.”

With ANP's managed security solution, you get management and monitoring of intrusion detection sensors and firewalls, all at a cost that is lower than a fifth of an annual the salary of one security technician.

“Our lack of a well-defined configuration management processes has led to issues with network reliability and performance.”

We have proven processes for most configuration change requests. Our security engineers will work with you on each configuration change to make sure there is no adverse impact on the security or availability of the environment as a result of an update or change request.

“We do not have the in-house expertise to effectively manage and monitor our network for security events.”

The expertise we've gained from more than seven years of managing security gives you a stronger security solution, as well as access to certified security engineers – all for less than it would be to do it yourself.

“We need summary reports that we can share with senior management to illustrate the value of network security.”

We offer event level reports together with summary reports to provide increased visibility and control for better decision-making. Reports such as “most common attacks,” “understanding the threat source” and “impact rating analysis” all help demonstrate the realities of network security, as well as what you are doing to protect the environment.

“We're not comfortable handing network security over to a service provider who does not understand our business.”

With our network security management solution, you are assigned a certified security engineer. Your engineer is an extension of your own team, working one-on-one with your staff to better understand your environment and provide you with a custom-fit solution.

“We cannot afford to have network downtime – and when a problem does occur, we need rapid resolution.”

Our proprietary, event driven polling platform and correlation engine allow us to react to security events faster than any other providers – leading to improved network security and performance.

“We do not want our staff focusing on false positives; we only want them involved in more important security events.”

ANP's advanced correlation engine allows us to identify, isolate and focus efforts on those security events that are most important and most threatening to a specific environment. This means less time figuring out what the event is and if you should be worried about it – and more time stopping the attack and/or solving the problem.
